

# Your Cloud-Connected Mainframe spend contributes to your Azure commitment

Now you can modernize your mainframe and contribute towards your Microsoft Azure Consumption Commitment

The Microsoft Azure Consumption Commitment (MACC) is a contractual commitment that your organization may have made to Microsoft Azure spend over time. Meeting this commitment can feel daunting.

To help you maximize the value of your MACC, Ensono has made its Cloud-Connected Mainframe for Azure available to purchase via Azure Marketplace. This not only simplifies and accelerates the procurement process, but enables you to offset a portion of the value of your investment against your Azure consumption commitment.

## How it works

- 1 When you invest in Ensono's Cloud-Connected Mainframe for Azure, our team will migrate your mainframe data and x86 workloads into Azure with low-latency, high speed access to the mainframe in the Azure-connected data center.
- 2 A portion of the cost of these mainframe data migration and integration services counts towards your Azure consumption commitment.
- 3 Increase your Azure consumption over time to meet your existing commitment and drive an increased commitment in future that will lead to even more savings on Azure services.

## About Ensono Cloud-Connected Mainframe for Azure

Ensono's Cloud-Connected Mainframe for Microsoft Azure allows mainframe and midrange systems to be hosted in close proximity to a Microsoft Azure data center, delivering low latency and zero ingress/egress charges.

The solution enables key cloud integration scenarios, such as mainframe data ingestion and conversion for AI, API integration, and DevOps integration. It also provides the perfect platform for legacy workload migration. With this solution, Ensono makes it easier to accelerate your modernization plan by providing unique contractual provisions that incentivize innovation without lock-in or penalty.
